

Commissioners:

The controversy concerning radiation from the power lines interfering with radio communications via BPL is very easily solved. Since the Amateur Radio Service is noted for its role in serving our nation, this will be just another service we will provide in the interest of arriving at the truth of the matter which the proponents claim we have not provided any evidence or justification for our concerns.

We will meet you at the test site with our radios and antennas and whatever else in the way of electronic test gear we need, to prove our case and to clear up the issue. The proponents deny we have any valid issues. Frankly, these apocryphal statements need to be refuted.

The commission has acknowledged that wide spectrum generators of radio frequency energy was not contemplated during the writing of the existing Part 15 rules. I agree that special new rules need to be drafted but not for the reason that the commission believes. They need to be more stringent in the allowable amount of wasted energy radiated. This will all be proved beyond a doubt when we show the pickup of stray signals on our radios and the consequent destruction of our communication media.

Let us get together with our equipment and your engineers to to put this issue to rest. Where these systems are we will come. Enough of the boilerplate from persons unfamiliar with radio and propagation of these signals. It appears the proponents would like to continue with rules NOT MADE FOR THEIR TECHNOLOGY, and to slowly degrade the radio spectrum with their radiation tests so we will join them to arrive at the truth.

I trust the commission will see our case in real world interference to the point denial will be impossible. Regarding deregulation and less rules the better:remember the Potential espoused in the Saving and Loan industry and the results. Remember airline deregulation and the telephone deregulation and their promises of potential. The potential I see is loss for stockholders and taxpayer monies in the pursuit of this technology whose time will never come. Please look carefully and soberly at these matters.
